Visa Inc. SWE Intern *Internship Acceptance Guide* A complete guide for aspiring interns

Student's Experience & Suggestions

Arko Dasgupta

1

Computer Science & Engineering

Name	Arko Dasgupta
Department	Computer Science & Engineering
Year of Grad.	2027

Experience

There was only one round which was a technical + HR round. My interviewer was very polite and soft spoken. She did not ask me any coding question (but note that they might ask you so be prepared, depends on interviewer's mood). She asked me about my past experience, thoroughly asked me about my projects and then some behavioural/situation based questions. It was a 50-60 min interview.

Prep. Tips

I would recommend that DSA should be on your tips. Practice problems each and everyday of different varieties. Also, doing 1-2 hands on project is a plus as interviewers ask questions specific to projects as well. Speak fluently and clearly, if you do not know any answer, don't try to answer questions if you are not sure, instead politely tell the interviewer that you haven't studied the concept yet. Keep a calm and cool mind and be confident.

Computer Science & Engineering

Name Md Khalid Saifullah

Department Computer Science & Engineering

Year of Grad. 2027

Experience

It was held on microsoft teams. Basically it depends on your luck I prepared more for DSA but the interviewer has a piqued interest in my projects so he grinned me very much on Project related topics ,techs used and reason behind it and the whole flow of my project. Then he asked me questions related to OOPS anyone having a deep knowledge of OOPS will be able answer all questions easily . Then he asked me HR related questions in which he gave me scenarios and how i would act in those scenarios

Prep. Tips

Know Your Project Well . Dont Lie , dont even dare to.

Computer Science & Engineering

Name Shreenjoy Halder

Department Computer Science & Engineering

Year of Grad. 2027

Experience

My interview was conducted online via Microsoft Teams. It began with the interviewer introducing himself, followed by my self-introduction. He then reviewed my resume and asked me to describe one of my projects. Out of the four listed, I chose to explain my GAN model project, which I described in detail, including its working principles and objectives.

He then asked about the scalability of the model and potential challenges in deploying it on a large scale. After that, he inquired about my knowledge of web development, since I mentioned I didn't have experience in that area, we moved on.

Next, he asked me to open the CodeSignal platform, where I was given a DSA problem to solve. Once I completed it, he discussed my approach and intuition behind the solution.

Although it was primarily a technical interview, the next part shifted toward HR-style questions, including topics like Visa processes, online payment transparency, teamwork experience, and even my favourite football player.

Toward the end, he asked if I had any questions for him. I took the opportunity to ask about areas where I could improve. He replied that I had done well and there was nothing to worry about. Afterthat, we wrapped up the interview.

Prep. Tips

Be ready to explain your projects clearly - focus on motivation, implementation, challenges, and scalability. Stay calm and confident during problem-solving and communication.

Additional Notes

Test your setup beforehand if the interview is online (camera, mic, internet). There were some problems regarding the internet connection in my interview.

Satyaki Banerjee	
4	Computer Science & Engineering
Name	Satyaki Banerjee
Department	Computer Science & Engineering
Year of Grad.	2027

Experience

The interview started with my interviewer introducing himself and his role in Visa. He then asked me about the courses I have studied/studying in my curriculum and my favorite programming language.

He then shared a CodeSignal code editor where I was asked to solve this leetcode hard question - <https://leetcode.com/problems/minimum-window-substring/>

I was initially a bit surprised as I did not hear about Visa asking hard level problems. I started by explaining my approach - a sliding window with a 26-size array to keep count of frequency of each character. I would extend the window, adding characters of string s and then check if all characters of string t are present in the window, and keep shrinking the window until the condition isn't true. I would store the starting index and the length of the substring and ultimately print that substring.

The interviewer seemed satisfied with my explanation and I coded my approach. It ran correctly on a test case. He asked me to analyse the time and space complexity, however did not ask me to optimise my solution.

After that he went through my resume and asked me questions about a gen-AI hackathon I participated in. I told him about what we built and what technologies we used. Other than that I had two web development projects, but he did not ask me any questions from there.

Before ending the interview, I asked him about the projects interns work at Visa, the tech stack they use and some general questions. My interview concluded in about 50 minutes.

Prep. Tips

1) Do not go into the interview keeping any bias from past interview experiences in mind. I was the only candidate who was asked a Leetcode hard question, many weren't asked to code, others were given easy questions. On the other hand, many of them were grilled on their resume and projects thoroughly but I wasn't asked that many questions from there. So the interview flow depends solely on the interviewer.

- 2) Do not be nervous at any point of time. If you feel that you do not know the solution to the question, clarify doubts with the interviewer. Explain your approach in a proper manner and while coding make sure to explain why you are doing what you are doing. Also code the approach that is coming into your mind, don't directly jump into the most optimal solution.
- 3) Your resume should be clean and to the point. Try to have atleast two good projects. Do not add anything in your resume that you are not confident about. Go through your resume thoroughly and your projects, you should know why you used a particular technology and any alternate approaches. Additionally questions on scalability might be asked so go through some system design concepts (optional).
- 4) Have a strong grasp over OOPs as many interviewers asked questions from OOPs. Also have a rough idea on OS and DBMS (sql queries).
- 5) Always communicate with the interviewer during the interview as he will be judging not just your problem solving skills, but also on your thought process and communication skills.
- 6) Although I wasn't asked any HR questions but prepare for some standard ones (like Why Visa, strengths and weaknesses etc). Also study some situation-based questions and prepare your answer using the STAR method.
- 7) Have a rough idea about the company and what it does. At the end of the interview, ask questions about the company, intern's role anything. They should feel that you are interested to join the company.

Additional Notes

All the best - You got this !!

Sombrata Biswas	
5	Computer Science & Engineering
Name	Sombrata Biswas
Department	Computer Science & Engineering
Year of Grad.	2027

Experience

The interview took place over Microsoft Teams. After basic introductions, I was asked what coding languages I knew. The interviewer was impressed that I knew SQL but I had mentioned that we had not covered it in our course yet so I was not asked any SQL Questions.

Next I was asked to explain my prior summer research internship at ISI Kolkata. I explained the work I had done on Graph Neural Networks and Graph Transformers alongside the current bottlenecks of the Graph Transformer which we were primarily working on. I explained the approaches we had used and the advantages and disadvantages of each approach for the particular problem.

After this I was asked some follow ups related to this and few questions about my projects. Then we moved on to the DSA part of the interview. I was asked to code over Teams and was asked two standard Leetcode problems of Rotate Array and Longest Substring Without Repeating Characters. I was able to get through this quite quickly within 10-15 mins. I had explained both the brute force and the optimal solution and the interviewer was satisfied with my approach.

Following the DSA round, we proceeded to the HR section. I was asked two questions in the HR portion. Firstly I was asked to explain any developmental role a person played in my life which could be a parent, relative or teacher etc. Secondly I was given a situation where I am working in a team over a project and there is no possibility of me finishing my task within the stipulated deadline and how I would approach this situation.

Prep. Tips

Some Preparation Tips would be:-

- 1) Practice DSA obviously over various coding platforms. Specifically for VISA since they use CodeSignal as the platform you could practice just the topics CodeSignal GCA tests. We were provided with practice resources from VISA and I also solved all the Leetcode tagged VISA questions.
- 2) Be thorough with your Resume and your Projects.
- 3) Although I was not asked any Core CS questions yet it is always good to be prepared for OOPS, OS, CN and DBMS.

Year of Grad.	2027

Experience

Let me give you a bit of context first. The selection process for the Visa internship has just two rounds: an Online Assessment and one final interview. You might wonder why there's only one interview. That's just Visa's approach; they believe the internship itself is the most thorough interview of a candidate.

Round 1: Online Assessment (OA)

So, Visa usually conducts their coding round on a platform like CodeSignal. The platform can change, so my advice is to get familiar with it beforehand. Just do a quick practice test on whatever platform they mention so you feel comfortable during the actual assessment.

Now, for the questions. We had 4 coding questions, ranging from easy to medium difficulty. A question might feel hard if you haven't seen a similar pattern before, which is why I can't stress this enough: practice is the key.

Here's a breakdown of the questions I got:

Q1. Sum of "Peak" Elements

Problem: Given an array, find the sum of all elements that are strictly greater than their immediate neighbors. For the first element (index 0), its only neighbor is the element at index 1. For the last element (index n-1), its only neighbor is at index n-2.

Example: `arr[] = {2, 1, 6, 7, 4, 5, 1}` -> `Sum = 2 + 7 + 5 = 14`.

Difficulty: Easy. A straightforward implementation question.

Q2. Drone's Walk

Problem: A drone travels on a number line from 0 to n. You are given an array `gasStations[]` containing points where the drone can refuel. When it refuels, its tank is full, and it can fly for 10 units of distance. If the drone runs out of fuel before reaching the next station, you have to "walk" it to the next available gas station. Your goal is to reach n and return the total distance you had to walk.

Example: `n = 42, gasStations[] = {1, 6, 11, 20, 30}`

Walk from 0 to 1 (1 unit).

Fly from 1. Can reach up to $1+10=11$. Gas station at 11, refuel.

Fly from 11. Can reach up to $11+10=21$. No station at 21. Next station is at 30.

Walk from 21 to 30 (9 units).

Fly from 30. Can reach up to $30+10=40$.

Walk from 40 to 42 (2 units).

Total walk = $1 + 9 + 2 = 12$.

Note: The example in the test was crucial. Even though the question said "nearest," the logic was to get to the next reachable station. Always study the examples carefully!

Q3. Smartphone Batteries

Problem: You want to use your phone for a total of T units of time. Each battery can power the phone for X units. After being used, each battery i takes $a[i]$ units of time to recharge. You have n batteries. Find the minimum number of full battery uses required to run the phone for T time. If it's not possible, return -1.

Example:

$T = 22$ units of time

$X = 4$ units (runtime per battery)

$a = \{13, 10, 4, 3\}$ (recharge times)

Walkthrough:

At $t=0$, use battery 1 (4 units). It will be free again at $t = 4 + 13 = 17$.

At $t=4$, use battery 2 (4 units). It will be free again at $t = 8 + 10 = 18$.

At $t=8$, use battery 3 (4 units). It will be free again at $t = 12 + 4 = 16$.

At $t=12$, use battery 4 (4 units). It will be free again at $t = 16 + 3 = 19$.

At $t=16$, battery 1 & 2 are still recharging. Battery 3 is free, so use it again (4 units).

At $t=20$, phone needs 2 more units. Battery 4 is free, so use it. Target $T=22$ is reached.

So full batteries = 5 (ans)

Note: This was an implementation-heavy question. The constraints mentioned that a brute-force approach (something like $O(n*T)$) would pass. They were testing intuition and implementation skills in this question.

Q4. Subarrays with K Pairs

Problem: Given an array of integers and a number k , return the number of subarrays that have at least k pairs of identical integers. A pair is two numbers with the same value (e.g., (1,1)). Each value can only contribute to one pair (e.g., three 1s is still just one pair of 1s).

Example: $arr = \{1, 1, 2, 4, 4\}$, $k = 1$. The answer is 7. Subarrays like $\{1,1\}$, $\{1,1,2\}$, $\{1,1,2,4,4\}$, $\{4,4\}$ etc., are valid.

Note: This was the trickiest one, requiring an efficient solution of $O(n)$ or $O(n \log n)$, likely using a sliding window or similar technique.

My takeaway from the OA: When questions are easy-medium, speed matters. But don't rush by constantly looking at the clock; that just reduces efficiency. The more you practice, the faster your thinking and implementation will become naturally.

Round 2: Technical + HR Interview

This was the only interview round. It was discussion-based, and honestly, a very good experience. The interviewers are trained to make you feel comfortable.

The Golden Rule: Know everything on your resume. The first thing my interviewer did was open my resume and start from there.

He laid out the interview plan:

His Introduction

My Introduction

Project Discussion

DSA Question

General & HR Questions

He started by asking me to explain the project on my resume. After a good discussion on that, we moved to the DSA question. It was a modified version of this GFG problem: <https://www.geeksforgeeks.org/dsa/array-element-with-minimum-sum-of-absolute-differences/> . My task was to print the element itself.

After that, we moved to behavioral questions like:

"Why do you want to join Visa?"

"What is your take on the future of AI?"

The interview lasted about 45-50 minutes. At the end, he asked if I had any questions for him.

Prep. Tips

1. DSA is King: This was the most important thing. I'd suggest practicing on LeetCode regularly. Giving contests helps a lot with speed. If you need a structured path, Striver's A2Z DSA sheet is a great resource.
2. Have Projects to Talk About: Make sure you have at least one or two projects on your resume that you can explain in depth.
3. Know Your Resume: I'm saying it again because it's that important. Be ready to justify every skill and course you've listed. (although my interviewer didn't go for every detail of it, still knowing it is important).

Additional Notes

Just one last tip: remember to check out the coding platform once before the actual OA. It really helps with confidence.

That's all from my side. All the best for your internship, everyone!
